BDI Agents and Planning

What?

- Agent architecture based on three “mental” structures:
 - Beliefs, Desires, and Intentions
- Based on a philosophical model for *practical reasoning*
- Provides a blueprint for agent reasoning, suitable for:
 - Agent implementations
 - Reasoning about other agents
- Key process is means ends reasoning:
 - Typically using a *plan library*
 - More recent work focuses on *automated planning*

Planning in BDI

Why?

- Focus of much research in AAMAS for the past three decades, primarily, on:
 - Agent Oriented Software Engineering
 - Agent reasoning cycle
 - Multiagent systems (populated by BDI agents)
- Relatively fewer efforts on the interface of means-ends reasoning and the agent model

Definition (Planning Task)

A planning task $\Pi = \langle \Xi, s_0, G \rangle$ is a tuple composed of a domain definition Ξ , an initial state s_0 , and a goal state specification G . A solution to a planning task is a plan or policy π that reaches a goal state G starting from the initial state s_0 by following the transitions defined in the domain definition Ξ .

Definition (Goal Recognition Task)

A goal recognition task $\Pi_{\mathcal{G}}^{\Omega_{\pi}} = \langle \Xi, s_0, \mathcal{G}, \Omega_{\pi} \rangle$ is a tuple composed of a domain definition Ξ , an initial state s_0 , a set of goal hypotheses \mathcal{G} , and a sequence of observations Ω_{π} .

Generalised Planning in BDI

Overview

- We define a high-level reasoning cycle based on previous work
 - Only declarative goals (no plan library)
 - Generalised planner as the primary means-ends reasoning process
- Key processes:
 - Intention selection
 - Desire filtering

Background Detour

Generalised Planning

Definition (Generalised Planning Problem)

A *generalised planning problem* $\mathcal{GP} = \langle \mathcal{P}_0, \mathcal{P}_1, \dots, \mathcal{P}_N \rangle$ is a set of planning problems ($N \geq 2$), where each problem $\mathcal{P}_i = \langle s_0, s_g \rangle$ that share some common structure (typically a planning domain Ξ). A solution to a generalised planning problem is a generalised plan $\Pi_{\mathcal{GP}}$, which when followed will solve any problem in \mathcal{GP} .

Reasoning Cycle

```
1: procedure REASONINGCYCLE( $\mathcal{B}, \mathcal{D}, \mathcal{I}, \Xi$ )
2:   loop
3:      $\mathcal{B} \leftarrow \mathcal{B} \cup \text{SENSE}(\ )$ 
4:     while  $\mathcal{I}$  is not empty do
5:       Pick an intention  $\langle \langle \varphi, D \rangle, \pi \rangle \in \mathcal{I}$  s.t.  $\mathcal{B} \models \varphi \wedge \neg D$ 
6:       ACT( $\pi$ )
7:       Find  $\{ \langle \varphi_1, D_1 \rangle \dots \langle \varphi_n, D_n \rangle \} \in \mathcal{D}^2$ 
         s.t.  $\exists \Pi, \Pi = \mathcal{G}\text{PLANNER}(\{ \langle \Xi, \mathcal{B}, D_1 \rangle \dots \langle \Xi, \mathcal{B}, D_n \rangle \})$ 
8:        $\mathcal{I} \leftarrow \{ \langle \langle \varphi_1, D_1 \rangle, \Pi \rangle, \langle \langle \varphi_n, D_n \rangle, \Pi \rangle \}$ 
```

Generalised Planning in BDI

Key advantages

- Generalised planning problems naturally deal with concurrent desires/intentions
 - Each desire is a sub-problem in \mathcal{GP}
 - Resulting generalised plan $\Pi_{\mathcal{GP}}$ analogous to BDI plan-rules
 - Means-ends reasoning inherits properties of the underlying plans
- Allows us to reason about BDI agent behaviour using goal recognition
 - Further automation in multiagent systems

All together now

Generalised Intent Recognition and BDI as a Theory of Mind

- We define a generalised goal recognition problem $\langle \mathbb{G}, \Omega_{\Pi} \rangle$, where $\mathbb{G} = \langle \mathcal{GP}_0, \mathcal{GP}_1, \dots, \mathcal{GP}_N \rangle$
- Solving this problem consists of computing posterior probabilities over \mathbb{G} given Ω_{Π} :

$$\mathbb{P}(\mathcal{GP} \mid \Omega_{\Pi}) = \eta * \mathbb{P}(\Omega_{\Pi} \mid \mathcal{GP}) * \mathbb{P}(\mathcal{GP})$$

All together now

Generalised Intent Recognition and BDI as a Theory of Mind

- We define a generalised goal recognition problem $\langle \mathbb{G}, \Omega_{\Pi} \rangle$, where $\mathbb{G} = \langle \mathcal{GP}_0, \mathcal{GP}_1, \dots, \mathcal{GP}_N \rangle$
- Solving this problem consists of computing posterior probabilities over \mathbb{G} given Ω_{Π} :

$$\mathbb{P}(\mathcal{GP} \mid \Omega_{\Pi}) = \eta * \mathbb{P}(\Omega_{\Pi} \mid \mathcal{GP}) * \mathbb{P}(\mathcal{GP})$$

- BDI reasoning cycle and goal recognition provide an effective *Theory of Mind*

Promising Approaches

Moving forward

BDI agents using our model now have a model and an inference mechanism to be fully aware of others:

- Adversarial Contexts (counterplanning)
- Cooperative Contexts (transparent planning)

Challenges and Opportunities

- This paper lays out a generic framework, but most of its components are still open research questions
 - Reasoning cycle
 - computationally expensive
 - high-level, no failures, replanning
 - Generalised recognition approaches are still in their infancy
- However, this provides a research agenda for many years to come
